Problem:

Limited support for mechanising temporal properties

Solution:

Interactive Proofmode for Temporal Logic in Rocq

Context:

We care about liveness and mechanisation

Liveness Properties and Temporal Logic

Liveness: something good eventually happens

- ▶ E.g.: Collaborating threads eventually make progress under fair scheduling
- ▶ Often studied in terms of labelled transition system (LTS) traces

Liveness Properties and Temporal Logic

Liveness: something good eventually happens

- ▶ E.g.: Collaborating threads eventually make progress under fair scheduling
- ▶ Often studied in terms of labelled transition system (LTS) traces

Liveness Properties and Temporal Logic

Liveness: something good eventually happens

- ▶ E.g.: Collaborating threads eventually make progress under fair scheduling
- ▶ Often studied in terms of labelled transition system (LTS) traces

Linear Temporal logic: logic for reasoning about traces

- ▶ $P \vdash Q \triangleq \forall tr. P \text{ } tr \rightarrow Q \text{ } tr$ where $P, Q \in \text{Trace} \rightarrow \text{Prop}$
- ▶ Here, Trace is a maximal labelled trace w.r.t. some LTS

Liveness Properties and Temporal Logic

Liveness: something good eventually happens

- ▶ E.g.: Collaborating threads eventually make progress under fair scheduling
- ▶ Often studied in terms of labelled transition system (LTS) traces

Linear Temporal logic: logic for reasoning about traces

- ▶ $P \vdash Q \triangleq \forall tr. P \text{ } tr \rightarrow Q \text{ } tr$ where $P, Q \in \text{Trace} \rightarrow \text{Prop}$
- ▶ Here, Trace is a maximal labelled trace w.r.t. some LTS

$a, b, a, \dots$

$b, b, b, \dots$

$b\dots, a\dots, b\dots$

Liveness Properties and Temporal Logic

Liveness: something good eventually happens

- ▶ E.g.: Collaborating threads eventually make progress under fair scheduling
- ▶ Often studied in terms of labelled transition system (LTS) traces

Linear Temporal logic: logic for reasoning about traces

- ▶ $P \vdash Q \triangleq \forall tr. P \text{ } tr \rightarrow Q \text{ } tr$ where $P, Q \in \text{Trace} \rightarrow \text{Prop}$
- ▶ Here, Trace is a maximal labelled trace w.r.t. some LTS

Most temporal logics are based on modalities, such as

- ▶ Next P : $\circ P \equiv \lambda tr. P(\text{tail } tr)$
- ▶ Globally P : $\Box P \equiv \lambda tr. \forall n. P(\text{tail}^n tr)$
- ▶ Eventually P : $\Diamond P \equiv \lambda tr. \exists n. P(\text{tail}^n tr)$

$a, b, a, \dots$

$b, b, b, \dots$

$b\dots, a\dots, b\dots$

Liveness Properties and Temporal Logic

  - iIntros "[Hlkd HR]". wp_if. iApply "HΦ"; auto with iFrame.
  - iIntros "_". wp_if. iApply ("IH" with "[HΦ]"). auto.
Qed.
```

Problem:

Limited support for mechanising temporal properties
(in Rocq)

Mechanising Temporal Properties in Rocq

Option 1: Going nuclear

- ▶ Give a paper proof / (unverified) translation to model checker
- ▶ Increases the trusted computing base
- ▶ Remove “All results have been mechanised” statement

Mechanising Temporal Properties in Rocq

Option 1: Going nuclear

- ▶ Give a paper proof / (unverified) translation to model checker
- ▶ Increases the trusted computing base
- ▶ Remove “All results have been mechanised” statement

Option 2: Do it yourself

- ▶ Mechanise proof ad hoc
- ▶ Given a custom trace definition with ever-growing suite of lemmas

Mechanising Temporal Properties in Rocq

Option 1: Going nuclear

- ▶ Give a paper proof / (unverified) translation to model checker
- ▶ Increases the trusted computing base
- ▶ Remove “All results have been mechanised” statement

Option 2: Do it yourself

- ▶ Mechanise proof ad hoc
- ▶ Given a custom trace definition with ever-growing suite of lemmas

Option 3: Use existing libraries

- ▶ Browse selection of existing (LTL) libraries in Rocq
- ▶ They focus on metatheory => limited helper lemmas / tactic support

Solution:

Interactive Proofmode for Temporal Logic in Rocq

Introducing Modal Temporal Logic Proofmode (MoTeL)

- ▶ Proofmode context for temporal logic

```
Lemma example (P Q : tProp) :  
  □ (P → ◊ ◊ Q) ⊢ ◊ P → ◊ ◊ Q.
```

```
Proof.
```

```
  iIntros "#HPQ HP".
```

```
  iMod "HP".
```

```
  iDestruct ("HPQ" with "HP") as "HQ".
```

```
  iApply "HQ".
```

```
Qed.
```

```
- S : Type  
- L : Type  
- Rel : S → L → S → Prop  
- P, Q : tProp
```

```
"HPQ" : P → ◊ ◊ Q
```

```
-----  
"HP" : ◊ P
```

```
-----  
◊ ◊ Q
```

Introducing Modal Temporal Logic Proofmode (MoTeL)

- ▶ Proofmode context for temporal logic
- ▶ Tactics for working with temporal modalities

```
Lemma example (P Q : tProp) :  
  □ (P → ◊ ◊ Q) ⊢ ◊ P → ◊ ◊ Q.
```

```
Proof.
```

```
  iIntros "#HPQ HP".
```

```
  iMod "HP".
```

```
  iDestruct ("HPQ" with "HP") as "HQ".
```

```
  iApply "HQ".
```

```
Qed.
```

Infrastructure for instantiation with custom LTS models

- ▶ Reflect LTS stepping relation as logic-level axioms
- ▶ Extract meta-level theorems about traces

Proof of eventual delivery for model of Stenning protocol

- ▶ In an unreliable network with a fair delivery assumption

Modal Temporal Logic Proofmode Demo

Developing the Modal Temporal Logic Proofmode

MoSeL: Modal Separation Logic (Proofmode)

- ▶ “Extensible Modal Framework for Interactive Proofs (in Separation Logic)”
- ▶ Foundation for the Iris Proof Mode (facilitating 150+ papers since 2015)
- ▶ Now also foundation for the Modal Temporal Logic Proofmode

Developing the Modal Temporal Logic Proofmode

MoSeL: Modal Separation Logic (Proofmode)

- ▶ “Extensible Modal Framework for Interactive Proofs (in Separation Logic)”
- ▶ Foundation for the Iris Proof Mode (facilitating 150+ papers since 2015)
- ▶ Now also foundation for the Modal Temporal Logic Proofmode

Key features of MoSeL

- ▶ Managed proof context for spatial and persistent propositions
- ▶ Extensible handling of modality-based reasoning via typeclasses
- ▶ Least and greatest monotone fixpoint constructions
- ▶ (Opt-in) step-indexing and separation logic
- ▶ Coming to Lean!

Developing the Modal Temporal Logic Proofmode

MoSeL: Modal Separation Logic (Proofmode)

- ▶ “Extensible Modal Framework for Interactive Proofs (in Separation Logic)”
- ▶ Foundation for the Iris Proof Mode (facilitating 150+ papers since 2015)
- ▶ Now also foundation for the Modal Temporal Logic Proofmode

Key features of MoSeL

- ▶ Managed proof context for spatial and persistent propositions
- ▶ Extensible handling of modality-based reasoning via typeclasses
- ▶ Least and greatest monotone fixpoint constructions
- ▶ (Opt-in) step-indexing and separation logic
- ▶ Coming to Lean!

Key insights

- ▶ Modality laws of Iris modalities resemble LTL modalities
- ▶ Separation logic and other unused features do not interfere

To Conclude

More case studies

- ▶ Looking for input and collaboration opportunities

More case studies

- ▶ Looking for input and collaboration opportunities

Temporal logic beyond linear

- ▶ Computation tree logic (CTL)
- ▶ Branching time μ -calculus $\rightarrow$ derived LTL and CTL

More case studies

- ▶ Looking for input and collaboration opportunities

Temporal logic beyond linear

- ▶ Computation tree logic (CTL)
- ▶ Branching time μ -calculus $\rightarrow$ derived LTL and CTL

Temporal separation logic

- ▶ Conceptually stimulating
- ▶ Practically unclear what it even means
- ▶ MoTeL might make it more feasible to test the waters

Support for mechanisation of temporal properties is warranted

- ▶ Currently limited support
- ▶ ITP-level solution preserves small TCB

Support for mechanisation of temporal properties is warranted

- ▶ Currently limited support
- ▶ ITP-level solution preserves small TCB

Modal temporal logic is suitable for interactive verification

- ▶ Modal laws facilitate smooth proof flows

Support for mechanisation of temporal properties is warranted

- ▶ Currently limited support
- ▶ ITP-level solution preserves small TCB

Modal temporal logic is suitable for interactive verification

- ▶ Modal laws facilitate smooth proof flows

MoSeL seems mature enough to handle new domain logics

- ▶ Relatively easy to instantiate
- ▶ Framework can handle functionality beyond original intent
- ▶ I encourage trying it out!
